

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (currently amended) A toothed belt (1), comprising a body (2) and a plurality of teeth (4); said teeth being coated with a fabric (5); said fabric (5) being treated with a liquid solution of RFL impregnating fibres of the fabric and successively coated on the outside with a resistant layer (8); said resistant layer (8) comprising adhering directly to said fabric and comprising a fluorinated plastomer[.] and an elastomeric material; and a vulcanizing agent; said fluorinated plastomer being present in said resistant layer (8) wherein said fluorinated plastomer is in an amount by weight greater than that of said elastomeric material; said toothed belt being characterized in that said fluorinated plastomer of between 101 and 150 parts by weight with respect to said elastomeric material and is formed for more than 50% by particles of average size smaller than 10 µm, and in that said resistant layer (8) is made to adhere directly to said fabric.
2. (original) The toothed belt according to Claim 1, characterized in that said fluorinated plastomer is polytetrafluoroethylene.
3. (currently amended) The toothed belt according to Claim [[1]]2, characterized in that said elastomeric material comprises HNBR.
4. (previously presented) The toothed belt according to Claim 3, characterized in that said elastomeric material comprises HNBR modified with a zinc salt of polymethacrylic acid.
5. (canceled)
6. (currently amended) The toothed belt according to Claim [[5]] 4, characterized in that said resistant layer (8) has a weight of between 50 and 80 g/m<sup>2</sup>.
7. (canceled)

8. (currently amended) A process for fabrication of a toothed belt, comprising:  
forming an elongate belt body of an elastomeric material, the belt having a first, planar side and a second side opposite the first side;  
forming teeth along the second side;  
coating the teeth with a fabric;  
treating the fabric with a liquid solution of RFL to impregnate fibres of the fabric;  
coating the treated fabric with a resistant layer comprising a fluorinated plastomer[], ] and an elastomeric material and a vulcanizing agent, the fluorinated plastomer being present in the resistant layer in an amount greater than between 101 and 150 parts by weight of an amount of the elastomeric material and comprising more than 50% particles of an average size less than 10 micrometers; and  
directly adhering the resistant layer to the fabric coated over the teeth.
9. (original) A process according to claim 8 in which the resistant layer is applied directly to the fabric via spreading.
10. (original) A process according to claim 8 in which forming the elongate belt body includes embedding a plurality of longitudinal filiform resistant inserts or cords in the elastomeric material.
11. (new) The toothed belt according to Claim 1, characterized in that said elastomeric material comprises HNBR.
12. (new) A process for fabrication of a toothed belt according to Claim 8, characterized in that it comprises a first step of treating a fabric with an RFL composition and a second step of spreading the resistant layer (8) directly on said treated fabric (5).
13. (new) A resistant layer (8) adapted to be adhered to the teeth of a toothed belt (1) and comprising a fluorinated plastomer and an elastomeric material; wherein said fluorinated plastomer is in an amount by weight of between 101 and 150 parts by weight with respect to said elastomeric material and is formed for more than 50% by particles of average size smaller than 10  $\mu\text{m}$ .
